

1. Write a program to find the length of the string without using inbuilt function (len)

```
  *
 * *
* * *
* * * *
* * * * *
```

2. Write a program to print all numeric values in a list\*\*  
Item = ['apple', 1.2, 'google', '12.6', 26, '100']
3. Write a function which takes a list of strings and integers. If the item is a string it should print as is and if the item is integer or float it should reverse it.\*\*  
l = [123, 345, "Hari", 125.5]
4. Function should accept a list and if any number divisible by 3 then modify to 33 or else keep it as it is  
s = [3, 6, 7, 8, 9]
5. Write a function to convert upper case to lower case and vice-versa without using inbuilt methods
6. Write a function to check if the number is Prime
